

# ProTx™ User Manual

---

## Overview

ProTx™ is a plain-text editor that I developed to facilitate the practice and learning of HTML, especially for learners. ProTx™ is not your regular plain-text editor because it has a few extra features; some to show-off my skills while the others are quite useful. All features are useful all the same.

I developed ProTx™ almost entirely with JavaScript! It is a complete web-ware; made with HTML and JavaScript.

Thank you for using ProTx™

Kheme

## The Menus

---

**The File Menu** The file menu has only three (3) sub-menus in this version:

**Save As**, **About ProTx™** and **Exit**. Now, I don't have to emphasize the function of the **Exit** sub-menu; obviously, it's to exit ProTx™.

The **About ProTx™** sub-menu only launches a pop-up box with what you might call the "Credits".

The **Save As** sub-menu activates the Save As command allowing you to save your new work with a name to your computer or to save a named work with another name to your computer.

The **Exit** sub-menu when clicked, closes ProTx™. If you try to exit without saving your work, ProTx™ will prompt you to save or discard resent changes made to your work before finally exiting. Also look to the end of this page for more reference pictures.

### The Options Menu

The **Options** menu has only two (2) sub-menus in this version: **Font** and **Music**.

The **Font** sub-menu launches a pop-up window that allows you to format the text as you work with ProTx™. You can choose your font face type, font colour and font size.

The **Music** sub-menu launches a pop-up window that allows you to choose the song/music you want to listen to while you work.

To add your own songs to the play list, simply copy your songs into the Music folder located within the ProTx™ folder.

You can copy the following types of files and they'll play without any problem: **.wma**, **.wax**, **.wav**, **.mp3**, **.mid**, **.mu3**, and **.cda**. Also look to the end of this page for more reference pictures.

## **The Help Menu**

The Help menu has no sub-menu. Clicking the Help menu launches this user manual you are reading now.

## Shortcuts & Extra Features

---

### Shortcut for Open

To activate the **Open** command, to open a file, press Control and O (CTRL + O) like in many other applications.

### Shortcut for New
